- NCERT Class 12 Introductory Macroeconomics, Chapter 5: Government Budget and the Economy

Core Factual & Conceptual Architecture

1. Constitutional Foundation & Core Objectives

- Constitutional Basis: Mandated by Article 112 of the Constitution of India, the Annual Financial Statement presents the estimated receipts and expenditures of the Union Government for a financial year running from April 1 to March 31.
- Allocation Function: Provides public goods that private markets fail to supply efficiently due to market failure.
 - Non-Rivalrous Consumption: One individual's usage does not deplete the quantity or utility available to others.
 - Non-Excludable Access: Prohibiting non-paying users (free-riders) is practically impossible.
 - Public Provision vs. Public Production: Financing a good through public revenues (provision) is distinct from manufacturing it within state-owned enterprises (production).
- Redistribution Function: Adjusts societal income distribution through progressive direct taxation and welfare transfer expenditures to reduce inequality.
- Stabilisation Function: Smooths fluctuations in aggregate demand, output, and employment by mitigating deficient demand (recessions) or excess demand (inflationary overheating).

2. Classification of Government Receipts

- Revenue Receipts: Government inflows that create no future financial liability and cause no reduction in existing government assets.
 - Tax Revenue:
 - Direct Taxes: Levied directly on personal income and corporate profits (such as Personal Income Tax and Corporation Tax); the incidence cannot be shifted.
 - Indirect Taxes: Levied on commodities, transactions, and services (such as Customs Duties and the Goods and Services Tax); the tax burden is passed on to buyers.
 - Non-Tax Revenue: Administrative earnings including interest on sovereign loans, dividends and profits from public sector undertakings, service fees, and external grants-in-aid.
- Capital Receipts: Inflows that either create a sovereign liability or reduce government financial assets.
 - Debt-Creating Receipts: Domestic borrowing from commercial banks, external sovereign loans, and borrowings from the Reserve Bank of India.
 - Non-Debt-Creating Capital Receipts: Recoveries of past loans given to state governments and proceeds from public disinvestment (equity sales in public enterprises).

3. Classification of Government Expenditures

- Revenue Expenditure: Outlays incurred for the standard administrative running of the government that neither generate physical or financial capital assets nor liquidate sovereign liabilities (such as interest outlays, defense operational costs, major subsidies, administrative salaries, and pensions).
- Capital Expenditure: Outlays that build physical infrastructure, create productive assets, or retire existing sovereign debt liabilities (such as highways, rail construction,

equipment, equity acquisitions, and loans advanced to states).

4. Deficit Metrics & Structural Significance

- Revenue Deficit:
 - Definition: Revenue Expenditure minus Revenue Receipts.
 - Economic Signal: Indicates the extent to which the government must borrow simply to fund day-to-day administrative consumption rather than asset creation.
- Fiscal Deficit:
 - Definition: Total Expenditure minus (Revenue Receipts plus Non-Debt-Creating Capital Receipts).
 - Alternative Formulation: Revenue Deficit plus Capital Expenditure minus Non-Debt Capital Receipts.
 - Economic Signal: Captures the total borrowing requirement of the government from all sources across an accounting year.
 - Financing Structure: Financed through domestic market borrowings, external bilateral and multilateral loans, and Reserve Bank borrowing.
- Primary Deficit:
 - Definition: Fiscal Deficit minus Net Interest Liabilities.
 - Economic Signal: Isolates current-year fiscal decisions by stripping out the accumulated burden of interest obligations from past debt cycles. A zero primary deficit means borrowing is dedicated entirely to paying interest on inherited debt.

5. Keynesian Fiscal Policy & Countercyclical Stance

- Core Mechanism: Deliberately adjusting government expenditure (G) and net taxation (T) to stabilize aggregate demand rather than maintaining a perpetually balanced budget.
- Countercyclical Expansionary Stance: Deployed during recessions (deficient demand) by increasing government spending (G) or cutting taxes (T). Injections expand output and employment via the autonomous spending multiplier.
- Countercyclical Contractionary Stance: Deployed during demand-pull inflationary peaks (excess demand) by trimming public spending or raising taxes to cool aggregate demand.
- Institutional Rule: The Fiscal Responsibility and Budget Management Act, 2003 (FRBMA) enforces medium-term fiscal glide paths, mandating the submission of the Medium-term Fiscal Policy Statement, the Fiscal Policy Strategy Statement, and the Macroeconomic Framework Statement.
